

Digital Retinal Imaging

Healthy Eye

Diseased Eye

As part of your comprehensive eye exam, you can elect to have a special procedure that consists of taking a photograph of the back portion of your eye (retina). This advanced technology produces a detailed photographic image of not only the retina, but also its blood supply and the optic nerve which connects your eyes to the brain.

These photos and the new technology become a permanent record of your eye health which enables the Doctor to help detect subtle changes earlier and diagnose possible disease sooner. Any change to your eye health is easier to recognize and if needed can easily be transferred to other health care providers.

Diseases that can be detected with Retinal Photography includes:

- Diabetes
- Glaucoma
- Macular Degeneration
- Hypertension
- Retinal abnormalities
- Cholesterol
- Stroke
- Cataract

In most cases dilation is not needed for retinal photos, however dilation may be required by your doctor. Screening digital retinal photography is not covered by many vision/medical insurance plans.

There is a \$25 fee (includes both eyes) for the procedure. Once photos have been taken the doctor will share the results with you.

****Please let our staff know if you prefer not to have imaging done.**
